

Curation Provenance Audit (2026-03-05)

Scope

- Candidate scope (pending,keeper): **4663**
- Source split:
 - **pinterest**: 3783
 - **facebook**: 546
 - **houzz**: 226
 - **scan**: 108

Key Findings

- If **title** is blanked in heuristic classification, **69** items change track and **99** items change room.
- Style room changes from title blanking: **46/3050** items.
- Dining-room assignments with outdoor evidence: **17** items.
- Missing board: **150**, missing labels: **64**, missing both: **47**.

Why This Is Compounding Error

- We mix heterogeneous fields (**title**, **description**, **board**, **notes**, **ai_summary**, **labels**) into one blob with no provenance weighting.
- **title** can originate from multiple pipelines and can be rewritten later; current curation does not track trust level per field.
- Room assignment is first-match keyword logic, so one noisy token can dominate.

Immediate Recommendation (Before More Ranking Work)

1. Freeze room taxonomy changes until provenance/trust model is defined.
2. Introduce **unknown/ambiguous** room instead of forced assignment when signals conflict.
3. Weight board/manual labels above generated titles and heuristics.
4. Keep pairwise only for ranking within trusted categories, not for category assignment.
